Tittel: An Investigation into the Distribution of Woody Plants on Remnant Patches in an Agricultural Landscape	Identifikasjon/datering
Forfatter: Michelle Cuzner-Charles	

Abstract (norsk):

Abstract (engelsk): The study focuses on 51 remnant forest patches in the intensively farmed region of Frogn. Present and past habitat configuration was investigated with relation to the richness of woody species. The patch area and connectivity was measured for both the present and past landscape. Past landscape configuration was calculated using aerial photographs from 1948.
